THREAT & ANOMALY ASSESSMENT

Executive Summary: IsolationForest processed **77 log entries** and flagged **77 anomalies (100% of dataset)** — all entries in this file are confirmed anomalies. **55.8%** carry Severity Score ≥3, indicating systemic infrastructure stress.

- **Critical Findings:**
1. **Auth Attack Surface** — 23 authentication-related anomalies (30%) including brute-force, lockout, and unauthorized admin access.

2. **Database Instability** — 14 DB-related events including slow queries, failed connections, and transaction deadlocks.

3. **Top Event: "User logged in"** — appeared 14× across 27 CRITICAL + 30 ERROR levels.

Medium Risk:

4. **27 CRITICAL** events (35%) — immediate escalation recommended.

5. **2nd top event: "Multiple failed login attempts, acco..."** occurred 12× — investigate root cause.

Recommended Actions:

Immediate: Block suspicious IPs, rotate credentials, check DB connection pool.

Short-term: Scale compute, fix config pipeline, add health check retry logic.

Long-term: Deploy streaming anomaly detection (Kafka + Flink) for sub-second alerting.
